Excitatory amino acids glutamate (GLU) and aspartate (ASP) another group of glutamate receptors was identified that were metabotropic receptors that are coupled to the second messenger cAMP (see Chapter 10 for a discussion of metabotropic receptors). The release of glutamate from nerve terminals is regulated by a metabotropic autoreceptor. There are eight different metabotropic glutamate

first, excitatory amino acids when applied to regions of the brain in vitro have been shown to induce burst firing and seizure-like phenomena. In the second, NMDA antagonists were shown to diminish or block the epileptic activity in well-established in vitro epilepsy models. The ability of NMDA to evoke burst firing has been demonstrated in a variety of brain regions, including the hippocampus

**Excitatory Amino Acids and Second Messenger Amazon es**

The renewal of interest in excitatory amino acids in the 1980s has altered the direction of neurobiology. L-Glutamate, widely regarded as a general perpetrator of nonspecific excitation, has become generally regarded as a widely distributed and important neurotransmitter in the CNS.
