In this article we will discuss about the saturated versus unsaturated flow of water into the soil. Flow of soil water is due to driving force resulting from potential gradient. Darcy law is valid both for saturated and unsaturated flow in that the flow is proportional to potential gradient. When the soil is saturated, all [ ]

ADVERTISEMENTS: Read this article to learn about the flow of water in saturated and unsaturated soils. Flow of Water in Saturated Soils: We know that groundwater is largely hidden and cannot be seen and understood as surface water. However, groundwater storage in saturated zone or groundwater reservoir forms a significant part of the total

Transient unsaturated flow differs from transient saturated flow as a result of the nonlinearity of the Richards equation, through the dependence of the hydraulic conductivity on the water content and of the large potential for water storage changes through changes in the volumetric water content.

Afterwards, we deal with water flow in a soil not fully saturated with water. This latter type of flow is commonly called unsaturated flow while the former is called saturated flow. To be more precise, we should distinguish the former from the latter flows as those occurring at positive and negative soil water pressures, respectively. If the flow of both air and water in the soil system is
