BRL1 and BRL3 are novel brassinosteroid receptors that

Loss-of-function of brl1 causes abnormal phloem:xylem differentiation ratios and enhances the vascular defects of a weak bri1 mutant. bri1 brl1 brl3 triple mutants enhance bri1 dwarfism and also exhibit abnormal vascular differentiation. Thus, Arabidopsis contains a small number of BR receptors that have specific functions in cell growth and vascular differentiation.

Plant Development I Tissue differentiation and function

Ground tissue carries out different functions based on the cell type and location in the plant, and includes parenchyma (photosynthesis in the leaves, and storage in the roots), collenchyma (shoot support in areas of active growth), and sclerenchyma (shoot support in areas where growth has ceased) is the site of photosynthesis, provides a supporting matrix for the vascular tissue, provides

TDIF Peptide Signaling Regulates Vascular Stem Cell

The indeterminate nature of plant growth and development depends on the stem cell system found in meristems. The *Arabidopsis thaliana* vascular meristem includes procambium and cambium. In these tissues, cell-cell signaling, mediated by a ligand-receptor pair made of the TDIF (for tracheary element differentiation inhibitory factor) peptide and the TDR/PXY (for TDIF RECEPTOR/ PHLOEM

Role of Cytokinin and Auxin in Shaping Root Architecture

This article presents an overview on the hormonal regulation of root vascular differentiation, growth and architecture, with specific emphasis on the role of auxin in roots, analysing specific IAA pathways in the vascular cylinder. Here the focus will be on the zone of cell differentiation where the PIN patterns are unclear, and where the primary vascular tissues start to differentiate and the

Auxin transport and vascular development SFU ca

The molecular mechanisms controlling vascular differentiation during plant organ development are not known, however, the capacity of the plant hormone auxin to induce vascular differentiation is well established (Lyndon, 1990 and references therein). Auxin-overproducing transgenic plants have increased amounts of vascular tissues (Klee et al., 1987) and application of auxin can induce the

The Induction of Vascular Tissues by Auxin and Cytokinin

Vascular development in the plant is an open type of differentiation, it continues as long as the plant grows from apical and lateral meristems. The continuous development of new vascular tissues enables regeneration of the plant and its adaptation to changes in the environment. This differentiation of vascular tissues along the plant is induced and controlled by longitudinal streams of

Differentiation in Plants Biology Encyclopedia cells

Differentiation in plants refers to the processes by which distinct cell types arise from precursor cells and become different from each other. Plants have about a dozen basic cell types that are required for everyday functioning and survival. Additional cell types are required for sexual reproduction. While the basic diversity of plant cell types is low compared to animals, these cells are
